Sistema Atlantis

Sistema Atlantis (Atlantis System) is an advanced system for creating cavities in general, under-floor cavities and ventilated floors in newly constructed or restructured civil and industrial buildings, accumulation tanks, dispersion tanks, honeycomb rafts, low temperature cold rooms.

The Atlantis System is used when the depth of the under-floor cavity or cavity is such that the classic Iglu® formworks cannot be used, with the advantage that the constant diameter of the elevator pipes makes it possible to minimise the use of concrete for filling. The main system features are speed, simplicity and cost performance.

Furthermore, with Atlantis, a sanitary space is obtained with a suitable humidity barrier and, if properly ventilated through piping connected outdoors, it is a tool for the disposal of the Radon gas present in the ground.

Advantages

- Ease of positioning as it is light-weight and simple to install through the linking of the elements, with time savings up to 80%.
- Minimum use of concrete for level filling thanks to the lowered dome form, which permits maximum resistance with minimum slab thickness.
- The possibility, due to the pipe system, to have any height up to 3 m supplied to the yard.
- Possibility to bear loads of considerable size by providing the vertical supports with suitable reinforcement.
- Adaptable to non-standard spaces as the modules can be cut without underpinning.
- Passage of systems under the pavement in all directions: perpendicular and diagonally.
- If used in combination with the disposable Muro formwork system it is possible to create elevation plates, both perimetric as well as intermediate, together with the upper slab preventing formwork dismantling, with considerable time savings.
- Total ventilation of the space and air flows in all directions.
- Simple material management in the yard, as it is not bulky and can be exposed to bad weather.

Atlantis System in combination with Muro formwork

Adjustment to different layouts thanks to the compensation accessories

Example of the passage of utilities

Perfect lateral occlusion thanks to the accessories

Easy to pose

Ramps

Compensate gaps of quotes

Applications

Atlantis is a system for creating under-floor cavities where there is considerable height available. It can be used for the distribution of systems and technological networks under the pavement so they do not need to be buried in screed.

It is suited for creating thermally insulated cavities for cold rooms with or without forced ventilation. It is the ideal solution for creating accumulation or dispersion tanks and for pool restructuring. Thanks to custom sized elevator pipes, it is the ideal system for creating inclined or multilevel surfaces.

Atlantis, when used in combination with the special Muro formwork, represents an innovative, quick and economic solution for the creation of honeycomb or box foundation rafts (superrafts), a reduced use of concrete and steel makes it possible to obtain extreme stiffness even if the ground does not provide much load bearing capacity.

⁽¹⁾ Characteristical values.

⁽²⁾ Project values.

The indicated overloads are those normally in use while the actual flow rates are much higher. The table expresses, starting from the various examples of overload and of thickness (to be given to the slab), the pressures that would be applied to the feet of the structure, in relation to the (eventual) thicknesses of the lean concrete.

Installation method (Images and schemes referred to Atlantis 50x50 cm with Ø 110 mm pipe)

The Atlantis System is made up of three basic elements in its standard configuration: Atlantis formwork h 16 cm (A), pipe (B) diameter 110 mm (external) and variable height, foot (C).

In order to plug the formworks laid against the wall, it is suggested to use the Tympanum accessory. The Atlantis formworks are simple to install: the procedure consists of inserting the pipe into the slip-on base and then linking the Atlantis formwork to the far end of the pipe using the bayonet coupling. Each piece can be hooked to the adjacent piece thanks to the shaped grooves for the male/female linking.

For this, simply position them in horizontal rows from the left to the right, with the arrow on the top turned outward from the operator, proceeding to the end of each row.

Thanks to the modularity and lightness of Atlantis, each operator will be able to position up to 30 sqm per hour standing comfortably in an erect position.

- 1 Preparation of the natural ground.
- 2 Preparation of the lean concrete foundation, to be sized according to the loads and capacity of the ground.
- 3 Pose of Atlantis system (foot+pipe+formwork)

- 4 Pose the elements from left to the right; once completed a row, proceed with next one.

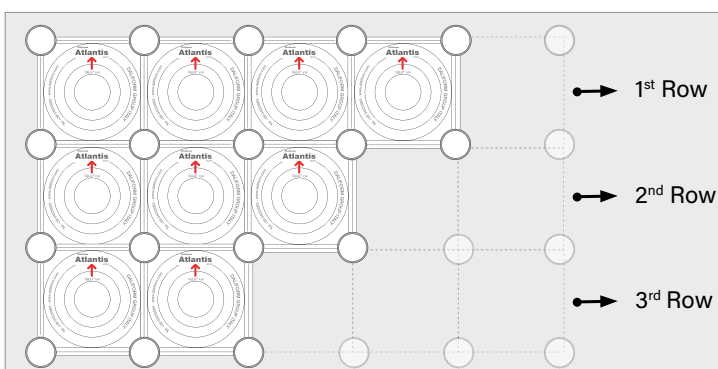

- 5 Laying the welded mesh Ø 6 20x20 above the formworks.
- 6 Insert the Tympanum accessory, between wall and formwork, along the cavity perimeter.

- 7 Realization of concrete casting, filling previously Atlantis pipes and then covering the formworks till reaching the quote of project.

To ensure a correct installation and perfectly created under-floor cavity please refer to the product's usage requirements.

Dry assembly method

- 1 Position the first element to the upper left with respect to the work surface, making sure that the arrow is pointing up;

- 2 Unite the elements in sequence, by horizontal row, proceeding from the left towards the right and from the top downwards (following the direction normally used for writing), as shown graphically on the crown of each unit.

Accessories

Tympanum

The Tympanum is an accessory with compensation and occlusion function, to be used in combination with the wall or whenever necessary.

The Tympanum is equipped with flexible vertical slats to adhere perfectly to the wall even in the presence of roughness and irregularity of the latter.

The accessory is made of recycled PP (Alaplen®) and is available for all sizes of the Atlantis System: 50x50 cm; 71x71 and 100x100.

The Atlantis System 50x50, for each square meter, needs 8 spacers.
The Atlantis System 71x71, for each square meter, needs 4 spacers.
The Atlantis System 100x100, for each square meter, needs 2 spacers.

Application example: deep, multi level foundations

The Atlantis System makes it possible to adjust the height of the elevator pipes within a centimetre, which can be supplied in different measurements. This will make it easy to quickly create structures at a low cost that require variable heights such as sloping ramps, slabs and multi-level slabs. Normally, slabs are created at the same height starting from the foundation bays that are on different levels (a classic example are "reversed T" beams or isolated foundations plinth), the Atlantis System makes it possible to easily create these structures without having to interrupt the regular placement of the formworks. The described system, if combined with the Muro formwork accessory, additionally reduces implementation times.

Application example: pool restructuring

It is known that a poorly dimensioned pool almost always causes operating problems, first of which is suitably heating the water at a reasonable cost. For this reason the bottom of the pool must sometimes be raised in order to reduce the volume of the water. A quick and economic solution to the problem, thanks to the high resistance, is to lift up the bottom using the Atlantis System.

The possibility to adjust the height of the elevator tube within a centimetre also makes it possible to easily create slopes in structures that have a finished bottom and surface inclined with different inclinations. The system can also be used for terracing.

Application example: access ramps

The Atlantis System makes it possible to quickly create ramps for accessing underground structures, with considerable savings in material use. In fact, instead of using materials such as sand, gravel or concrete, it is possible to create a foundation for the ramp that has the same height of the adjacent structure (parking area) and create a space with an inclined vehicle accessible slab on the top. The Atlantis System can also be used for curved ramps.

Daliform Group technicians are available to you to help you design your under-floor cavity, and upon request can provide customised studies with calculations and executive drawings.

Application example: formwork raft

The purpose of the foundation structures is to minimise deferred deformation due to the irregularity of the ground and asymmetric loads to ensure building stability. It is the two latter aspects that represent the true danger to the integrity of the foundation and the overlying structure. Once the type of foundation that is best suited for distributing the loads in the ground has been identified, based on the characteristics of the building and ground, the problem goes from being technical to economical, therefore the most economic solution must be identified for implementing the selected solution.

A solution to this problem, without changing the type of structure, is to create a box type raft (or formwork). This obtains a honeycomb structure consisting of two flat plates connected by mutually perpendicular beams: lower and upper slabs with a thickness of 15-20 cm with connection beams with a height of 70-120 cm positioned at variable centre distances

depending on static requirements. Thanks to the Iglu® or Atlantis formworks from the Daliform Group, in association with L-Plast panels or Muro formwork, it is possible to complete the raft structure in only two phases; that is casting the lower slab on which the Daliform Group products are positioned and then casting the beams and compression slab at the same time. This makes it possible to create extremely rigid foundations at a limited cost.

The main function of the foundation structures, such as the one proposed by the Atlantis System is to distribute the loads from the pillars, plates and walls to the ground and at the same time anchor the building to the ground, guaranteeing its stability. In some cases, always using the Atlantis System, foundation piles can be eliminated, which would instead be necessary with other construction solutions.

Compensation

Construction details illustrating various solutions aimed at compensating structures in case that the internal dimensions of the crawl space are not exact multiples of the formwork Atlantis.

Certifications

- Technical Construction Certificate issued by the Technical and Test Institute for Constructions Prague (Czech Republic).
- Technical Construction Certificate issued by the Agency for Quality Control and Innovation in Building (Hungary).
- Hygienic Certificate issued by the National Institute of Hygiene (Poland).
- Acoustic check for the verification of DIN standards.
- Series of loading and breaking tests certified by the University of Padua.

Daliform Group technical office

FEASIBILITY STUDY

Predimensioning and optimisation of the structures, alternative and/or revised proposals, material and manpower estimates, cost analysis.
Evaluation of forced ventilation in the case of cold rooms.

CALCULATION REPORT

Reports certifying the execution of Daliform Group constructive systems.

SUPPORT FOR THE EXECUTIVE DESIGN

Support by design professionals. Upon request, the formwork positioning plan can be supplied with a list of the products required to carry out the work and the relative accessories.

ON-SITE SUPPORT

If necessary, our technical staff can be present on-site to help the construction company during the operational phase.

The technical consultancy is only valid for the Daliform Group construction systems.

Specifications

Implementation of a ventilated under-ground cavity for a total height of _____ cm with the supply and on-site positioning of recycled plastic Atlantis System formworks from the Daliform Group, consisting of modular formworks positioned dry for the quick formation of a self-bearing pedestrian accessible platform above which the C25/30 concrete is cast to fill the formwork up to its crown and an upper slab of _____ cm reinforced with welded mesh Ø _____ cm 20 x 20 cm, levelled and smoothed with a trowel.

The Atlantis System shall be composed of recycled plastic formwork such as Iglu[®] with convex cover with dimensions 50x50 cm, h 16 cm and sustained by pipes Ø110 mm, di h _____ cm, complete with slip on bayonet connection feet, which can be walked on when dry, guaranteeing a breaking resistance of 200 kg in correspondence of the centre of the arch with an 8 x 8 cm clamp.

or

The Atlantis System shall be composed of recycled plastic formwork such as Iglu[®] with convex cover with dimensions 71x71 cm, h 15 cm and sustained by pipes Ø110 (or Ø125 or Ø140) mm, di h _____ cm, complete with slip on bayonet connection feet, which can be walked on when dry, guaranteeing a breaking resistance of 200 kg in correspondence of the centre of the arch with an 8 x 8 cm clamp.

or

The Atlantis System shall be composed of recycled plastic formwork such as Iglu[®] with convex cover with dimensions 100x100 cm, h 12 cm and sustained by pipes Ø110 (or Ø160) mm, di h _____ cm, complete with slip on bayonet connection feet, which can be walked on when dry, guaranteeing a breaking resistance of 200 kg in correspondence of the centre of the arch with an 8 x 8 cm clamp.

Formworks in recycled plastic, such as Iglu[®], for the formation of the Atlantis system, must be made of "ALAPLEN[®] CP30", must not release polluting substances, have an Environmental Compatibility Certification and be produced by a Company Certified according to International Standards UNI EN ISO 9001 (Quality), UNI EN ISO 14001 (Environment); UNI EN ISO 45001 (Safety) and SA 8000 (Social responsibility).

The company that supplies the formworks such as Iglu[®], for the formation of the Atlantis system, must provide the technical and security sheet of the product and the granule "ALAPLEN[®] CP30" and also exhibit the product certificate approved by an EOTA (*European Organisation for Technical Approvals*) member agency.

Including accessories, waste, cutting and all other expenses: _____ /m² _____

Supply and installation cost grid

Sample referred to Atlantis system 100x100 cm having pipe Ø 110 mm

No.	Item	U.M.	Quantity	Unite price	Total
1	Supply of Atlantis formwork L 100 x L 100 x H 12 cm	m ²	1		
2	Supply of Ø 110 mm pipe with base	no.	4		
3	Dry positioning of the Atlantis system on the foundation	h/m ²	0,05		
4	Supply and positioning of the welded mesh Ø 6/20x20 cm	kg/m ²	2,328		
5	Supply and casting of concrete C25/30 - formwork up to the crown	m ³ /m ²	0,034		
6	Supply and casting of concrete C25/30 - filling of the pipes*	m ³ /m ²			
7	Supply and casting of concrete C25/30 - thickness upper slab	m ³ /m ²			

* 0,036 m³/m² per m of pipe

Total cost €/m²

Logistics - pallet capacity

MEANS OF TRANSPORT	NO. PALLET ATL 50x50	NO. PALLET ATL 71x71	NO. PALLET ATL 100x100	
Tractor (8,20/9,60x2,45)	14/16	15/18	14/16	
Trailer (6,20x2,45)	10	12	10	
Tractor + Trailer type "BIG" (8,40+7,20x2,45)	14+12	15+12	14+12	
Semi-trailer (13,60x2,45)	24	27	24	
20 feet container	10*	10*	10*	 20 feet
40 feet container	22*	24*	20*	 40 feet

* The m² per pallet can vary based on the type of container.
